Data are expressed as number positive/number tested

Abbreviations used in this report:

ELISA=enzyme linked immunosorbent assay, MICR=microscopy, MAC= macroscopic

IFA=immunofluorescence assay ,MFI= multiplex fluorescent immunoassay, CULT=culture,

PCR=polymerase chain reaction, NT=not tested

Tests were conducted in TAU & Charles River laboratories

Conclusions of the latest results

On serology: Two mice (55 ,53 LS rooms (8,9) 21) were expressed **MNV** antibodies and one mouse (53LS room 8, 9) was expressed **MHV** and **GDVII** antibodies.

On PCR: One mouse (54LS room 20) was found positive results for **Helicobacter rodentium**.

On parasitology: Micro fauna

On Bacteriology: Two mice were found positive for **Pasteurella pneumotropica**-yellow lytic colonies

Remark:

Identification of *Pasteurellaceae*:

Pasteurella pneumotropica grows as gray colonies on blood agar whereas “Other *Pasteurellaceae*” refers to yellow lytic colonies. Both are gram-negative and API-20NE-positive (99%). Occasional confirmation by RT-PCR for the ITS region (IDEXX BioResearch) or 16S rRNA PCR and sequencing (Hy Laboratories and IDEXX BioResearch) indicates that the gray colonies are *Pasteurella pneumotropica* (99%, GeneBank accession number: M75083.1, NR_042887.1) and the yellow colonies are *Pasteurella spp* (100%, GeneBank accession number: HF912264, JQ346058). Note that the JQ346058 sequence, which is called *P. pneumotropica* in GenBank, is not well characterized and is not associated with any publications. It is an outlier compared to all the other well-characterized *P. pneumotropica* isolates in the GenBank and is 100% identical to a *Pasteurella spp* (HF912264), which is better characterized.

NOTE: Viridans group alpha *Streptococcus*, coagulase negative *Staphylococcus sp.*, *Enterococcus sp.*, *Lactobacillus sp.*, *Lactococcus sp.*, and *Escherichia coli* were isolated. These bacteria are common components of the micro flora.
