Health monitoring summary

Serology: 10 mice (3rd and 4th floors) were positive for Murine novovirus (MNV).

Parasitology: All tested mice were negative for endoparasites-pinworms and ectoparasites-mites.

Bacteriology: One mice was positive for *Pasteurella pneumotropica* (yellow lytic colonies; 4th floor, room 407, carrier 5).

Two mice were positive for *Staphylococcus aureus* (4th floor, room 409, carriers 1-2).

*We consider the bacteriology mice samples positive for *Helicobacter spp.*

Growth Pathology: No pathology lesions.

Remarks:

Identification of *Pasteurellaceae*:

Pasteurella pneumotropica grows as gray colonies on blood agar whereas "Other *Pasteurellaceae*" refers to yellow lytic colonies. Both are gram-negative and API-20NE-positive (99%). Occasional confirmation by RT-PCR for the ITS region (IDEXX BioResearch) or 16S rRNA PCR and sequencing (Hy Laboratories and IDEXX BioResearch) indicates that the gray colonies are *Pasteurella pneumotropica* (99%, GeneBank accession number: M75083.1, NR_042887.1) and the yellow colonies are *Pasteurella spp* (100%, GeneBank accession number: HF912264, JQ346058). Note that the JQ346058 sequence, which is called *P. pneumotropica* in GenBank, is not well characterized and is not associated with any publications. It is an outlier compared to all the other well-characterized *P. pneumotropica* isolates in the GenBank and is 100% identical to a *Pasteurella spp* (HF912264), which is better characterized.

Viridans group alpha *Streptococcus*, coagulase negative *Staphylococcus sp.*, *Enterococcus sp.*, *Lactobacillus sp.*, *Lactococcus sp.*, and *Escherichia coli* are all common components of the micro flora. *Trichomonads*, *Chilomastix* and *Entamoeba* are all common components of micro fauna.
